**ABSTRACT**

Growth monitoring is one of the main activities of the nutrition improvement program that focuses on preventing and improving the condition of child nutrition. Weighing infants and toddlers at the Posyandu is a community effort to monitor growth and development. The coverage of toddler services in East Java Province in 2016 reached 82.60%, and there were 16 districts / cities that had not yet achieved the specified target (83%). Overview of the level of community participation in Posyandu Karangtengah Prandon Village, Ngawi Subdistrict, January 2018 67%, February 75%, March 69%, April 69% May 73% June 60% July, 63% September is 59%, October is 56% and November is 58% and December is 60%. The purpose of this study is to identify the relationship of education, employment, knowledge, and attitudes of mothers with the activity of balancing toddlers in Posyandu. This type of research is observational analytic with the type of cross sectional approach. The method of data collection is done by interviews and using questionnaires. The population in this study were mothers and toddlers who attended the Prandon integrated health post during the study taken by random sampling technique so that the sample size in this study was 40 people. The results obtained were 67.5% of mothers with junior high / high school education, 55% of mothers did not work, 47.5% of mothers were highly knowledgeable, 60% of mothers had good attitudes, and 55% of mothers were under fives. Analysis of bivariate data with Spearman showed no significant relationship between education, work, knowledge, and attitudes of mothers with the activity of weighing children under five in Posyandu Karangtengah Prandon Ngawi.

Keywords: *Mother of Toddlers, Activeness of Mother Toddler, Posyandu*
